- None reported.

WEATHER OF CONCERN

Weather of Concern

- A Pacific Trough will produce light rain and snow showers for portions of Northern California and record low temperatures for Southern California, today through Thursday, 02/22/18.

Active Weather Warnings, Watches and Advisories by County:

- <https://alerts-v2.weather.gov/counties/CA>

WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

An unsettled and weather pattern will affect the region through the rest of the month. Periods of precipitation, better mixing and cooler than normal temperatures will be the main weather impacts during this period.

A series of shortwave Pacific troughs will move over the area and provide periods of lighter rain and snow showers. The first system will impact the region tonight and Wednesday with a secondary dose of precipitation Wednesday night into Thursday. Another wave is expected later during the weekend into early next week. Peak liquid water amounts will generally range between 0.3 to 0.6" with each main system passage. The Sacramento Valley and portions of the Bay area look to receive lesser amounts due to the path of the trough passages. The wind flow will be lighter today and Wednesday but will increase Thursday and Friday. Peak winds should occur Thursday night during the main cold frontal passage with potential gusts between 40 to 50 mph and possibly more for portions of the Sacramento Valley and higher ridges across the greater Bay area. Lighter winds should return Saturday before another frontal passage late weekend or early next week. Humidity levels don't appear to be unusually low during the next several days including the stronger wind period. Temperatures will be on the cool side with hard freezing in areas once again tonight. High temperatures should be below normal each of the next 7 days.

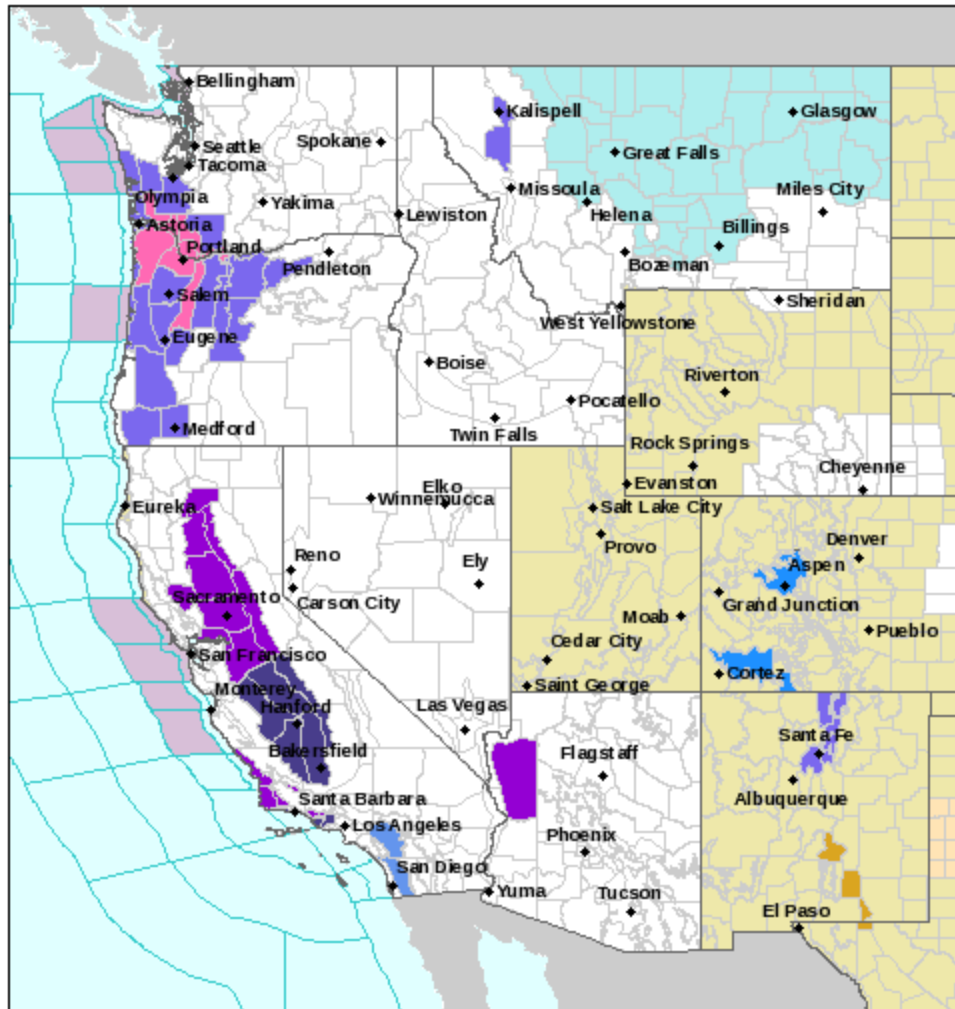

Confidence is pretty solid for the overall pattern shift. This means more precipitation and cooler weather compared to the first two weeks of the month. Timing of the system impacts will most likely change, especially for the weekend and early next week period due to the progressive nature to the atmospheric pattern.

SOUTHERN CALIFORNIA

A deep trough over the West Coast will maintain well below normal temperatures across the region through Friday, with mid 30s to mid 40s across the mountains and 50s to low 60s in the valleys. A couple of weak disturbances in the trough will drop south from Canada bringing scattered showers to the region Wednesday through Friday. Most locations will receive less than a quarter inch of total rainfall with these two disturbances. The snow level will be around 3,000 feet. Westerly winds of 20 to 40 mph with gusts to 60 mph will surface across the wind prone mountain and desert areas Thursday. The trough over the West Coast will weaken causing temperatures to warm this weekend, but temperatures will still be a little below normal. Temperatures will become well below normal early next week as the trough strengthens over the West Coast once again. Another disturbance will drop down from Canada bringing scattered showers with light rainfall totals early next week. Snow levels look to remain around 3,000 feet.
